Study #4693

Contributing Projects:

- P2311 - 2021 Alliance Outcome Impact Case Reports

Part I: Description and all information of the outcome/impact reported

Type: OICR: Outcome Impact Case Report

Status: On-going

Year: 2021

Outcome Impact Case Report link: [Study #4693](#)

Title: The Government of Ucayali, Peru, adopts deforestation-free, low- emissions strategies to strengthen cocoa and palm oil value chains

Short outcome/impact statement:

The strategies developed to promote deforestation-free, low- emission cocoa and oil palm value chains have been officially adopted by the regional government of Ucayali to guide public and private stakeholders towards improved sectorial and agricultural development. Both documents have been developed by the Alliance of Bioversity and CIAT in the framework of a project on "Business models to address drivers of deforestation in Peru" or Sustainable Amazon Businesses (SAB).

Outcome story for communications use:

Peru is introducing sustainable business models in the agro-industry and livestock sectors to reduce greenhouse gas emissions (GHG) caused by deforestation. The goal is to increase productivity in deforested areas and achieve an agricultural production system that is deforestation-free. The strategies: (Moving towards a palm oil value chain that contributes to the conservation of forests and a reduction in greenhouse gas emissions and Moving towards a deforestation-free cacao and chocolate value chain with low greenhouse gas emissions) and the business models will contribute to the climate protection goals laid down in the Peruvian NDC (Nationally Determined Contribution) and the Joint Declaration of Intent on REDD+ (JDI) . Both documents have been signed by the Governor of the Ucayali region and have been approved by the Ministry of Agrarian Development and Irrigation (MIDAGRI) and the Ministry of Environment (MINAM). The documents build upon the strategies to strengthen the regional competitiveness plans for the cocoa and the palm oil value chains, designed by the Alliance of Bioversity and CIAT in the framework of the SAB project, approved through a Regional Executive Resolution, No. 322-2020-GRU-GR.

CGIAR innovation(s) or findings that have resulted in this outcome or impact:

The CGIAR research that resulted in this outcome is the direct result of our having established the linkages between deforestation and cacao, coffee, palm oil, and cattle production in Peru (1).

Innovations: <Not Defined>

Link to Common Results Reporting Indicator of Policies : Yes

Policies contribution: <Not Defined>

Elaboration of Outcome/Impact Statement:

To contribute to Peru's vision of zero net deforestation through various means, including sustainable business models, value chain actors (i.e., producers, buyers, service providers, public and private investors, policymakers) have developed and adopted new value chain strategies that will be piloted through specific business models (2,3). The first step in this process was an initial characterization, analysis, and prioritization of value chains with the potential for reducing deforestation and carbon emissions in the Peruvian Amazon (1). Involvement of relevant private sector players and investors was crucial for their early engagement and commitment to the subsequent design of value chain upgrading strategies and the implementation of business models.

Based on the value chain assessments, the project designed and agreed on upgraded practices with the relevant value chain actors that target zero deforestation and low emissions goals in prioritized value chains (4,5). The greenhouse gas (GHG) mitigation practices proposed for the cocoa and palm value chains include the use of organic fertilizers, crop residues and legume species, the implementation of agroforestry systems, and the establishment of conservation agreements. The use of organic fertilizers, crop residues and nitrogen-fixing plants reduces GHG emissions by replacing chemical fertilizers and increasing the soil organic carbon. Agroforestry systems contribute to the sequestration and long-term storage of carbon in forest trees. The conservation agreements, together with the geolocation and monitoring of the farms, will prevent land use change, ensuring a business model free of deforestation (2,3).

These practices were consolidated into a value chain upgrading strategy that includes a plan of action with a specific timeline and clearly defined stakeholders' roles and responsibilities to ensure they pursue their joint goal.

The regional government of Ucayali has now formally adopted the guiding documents, the information, and the capacity provided by the Sustainable Amazon Businesses project converting them into regional strategies to continue developing deforestation-free and low-GHG emission value chains (2,3).
